

# Before we start variables ...

## Let's do a quiz!

# C Programming

## Variables

Variables  
keep track of  
data

# Variables

vary  
in  
value

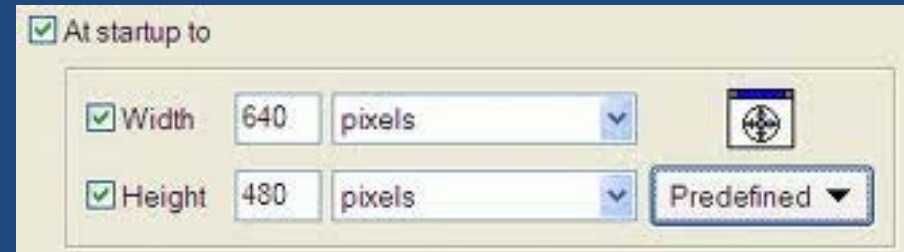

Variables have:  
Names ...

Variables have:  
Names,  
Data Types ...

Variables have:  
Names,  
Data Types,  
Initial Values

A screenshot of a software configuration dialog box. The dialog has a title bar and a main area with several controls. At the top left, there is a checked checkbox labeled "At startup to". Below this, there are two rows of controls. The first row is for "Width", with a checked checkbox, a text box containing "640", a dropdown menu showing "pixels", and a small icon of a monitor with a crosshair. The second row is for "Height", with a checked checkbox, a text box containing "480", a dropdown menu showing "pixels", and a button labeled "Predefined" with a downward arrow. The dialog box has a light beige background and a standard Windows-style border.

Property	Value	Unit
Width	640	pixels
Height	480	pixels

A variable  
declaration  
is used

to tell the compiler  
about your variable

# It's like an introduction ...

Done

Secure Search

McAfee

You wouldn't  
let  
someone  
work for  
you without  
knowing a  
bit about  
them

**FIRED**

As it turns out, those **were** the droids you were looking for.

Declare a  
variable before  
or when  
it's used  
for the first time

For now,  
let's declare variables  
at the start of the function

```
int main()  
{  
  int population = 1;  
  int countries = 1;
```

# Example from our sample program

```
int number = 9;
```

# Review!

What's a variable declaration?

# Review!

What are the three main important parts of a variable declaration?

# Data Type????

Data Type  
indicates:  
format ...

Data Type  
indicates:  
format,  
precision ...

Data Type  
indicates:  
format,  
precision,  
range ...

Data Type  
indicates:  
format,  
precision,  
range,  
sign

# Example #1

*int*

Format: integer

Range:  $\pm 2$  billion  
and change

Precision: 32 bit

Sign: can be positive  
or negative

# Example #2

*float*

Format: floating-point  
(real)

Range:  $\pm 10^{38}$

Precision: 32-bit

Sign: can be positive or  
negative

# Example #3

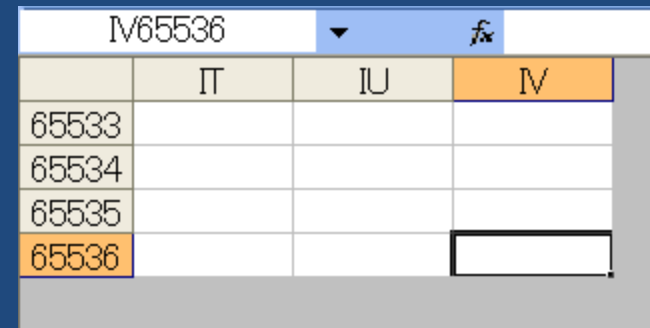

*unsigned short*

Format: integer

Range: 0 to 65535

Precision: 16-bit

Sign: positive only

The image shows a screenshot of a data table, likely from a software application. The table has three columns: 'IV', 'IU', and 'IV'. The first column is labeled 'IV65536' in the header. The rows are numbered 65533, 65534, 65535, and 65536. The row for 65536 is highlighted in orange. The table is part of a larger interface with a blue header bar and a grey border.

IV65536	IV	IU	IV
65533			
65534			
65535			
65536			

# Review!

Name a data type.

# Review!

Name another data type.

# Other Common Data Types

*char*: single character or integer  
with small range

*unsigned char:*  
positive-only  
integer with  
small range

*unsigned int*: positive-only integer  
with large range

# Review!

Can the number -6 be stored in  
an unsigned int?

*double*: floating-  
point (real)  
number with  
greater  
precision than  
float

Size determines  
range

# 8-bit integers are limited to 256 values

(remember, 1 byte is 8 bits)

11111111 **plus 1** →

| 6-bit integers are limited to  
65536 values

1111111111111111 plus 1

32-bit integers are  
limited to 4  
billion and  
change

(don't bother memorizing  
the actual number)

# Review!

Can the number 6 be stored in  
an int?

# Integer ranges

char and unsigned char are 8-bit values

0 TO 255

**-128 to 127**

short and unsigned short are  
16-bit values

-32768 to 32767

0 to 65535

long and unsigned long are 32-bit values

big negative number near -2 billion  
to  
big positive number near 2 billion

**0 to big number near 4 billion**

int is a bit different

int is defined as the  
most efficient  
integer data type  
for the processor

# Section 6.2.5 of the ANSI C Standard

“A ‘plain’ int object has the natural size suggested by the architecture of the execution environment (large enough to contain any value in the range `INT_MIN` to `INT_MAX` as defined in the header `<limits.h>`).”

16-bits

8-bits

# Visual Studio 2010 and 2012

# 32-bits

The screenshot shows the MSDN website in a Mozilla Firefox browser. The page title is "Data Type Ranges". The breadcrumb trail is "Home > Library > Learn > Downloads > Support > Community". The search bar contains "maxint". The left sidebar shows the "Data Type Ranges" link under "Fundamental Types". The main content area is titled "Data Type Ranges" and "Visual Studio 2010 | Other Versions". It states: "For 32-bit and 64-bit compilers, Microsoft Visual C++ recognizes the types shown in the table below. Note that the following type also have unsigned forms:"

- **int (unsignedint)**
- **\_int8 (unsigned\_int8)**
- **\_int16 (unsigned\_int16)**
- **\_int32 (unsigned\_int32)**
- **\_int64 (unsigned\_int64)**
- **short (unsignedshort)**
- **long (unsignedlong)**
- **longlong (unsignedlonglong)**

Type Name	Bytes	Other Names	Range of Values
int	4	signed	-2,147,483,648 to 2,147,483,647
unsigned int	4	unsigned	0 to 4,294,967,295
int8	1	char	-128 to 127

The browser's status bar shows "Done" and "Secure Search". The taskbar at the bottom includes McAfee and other system icons.

# Assumption for Exams

On exams,  
assume that ints are 32-bits in  
size

# Review!

Can the number 6 trillion be stored in an int in this course?

# Sign

char, short, long, and int all can  
have positive and negative  
values

How about  
*unsigned int?*

Starts at 0 and  
goes up to  
double the  
signed upper  
limit (plus 1)

This doesn't apply to float and double

# One weirdity with float and double

float and double have a  
discontinuity near 0

1 /

# Review!

Can the number 6.4 be stored  
in an int?

# Review!

Can the number 6.4 be stored  
in a float?

# Choosing Data Type

5 criteria

5

5

# Criterion #1

Do you need floating-point support?

# Criterion #2

What are the possible values?

# Criterion #3

Do you need to minimize the amount of memory used?

# Criterion #4

Do you need to  
maximize speed?

# Criterion #5

Are equality comparisons  
needed?

# Review!

What would be an example of when you would want integers stored in 8 bits?

# Initializing Variables

The compiler doesn't require  
initialized variables

**NOT REQUIRED**

I do.

**YES!**

**YES.**

**HARD HATS  
REQUIRED ON THIS  
JOB BY ALL  
EMPLOYEES**

# Review!

Will you get better marks if you  
do what I tell you you need to  
do?

The compiler  
doesn't care  
about the  
quality of  
your code

## INEPTITUDE

If you can't learn to do something well,  
learn to enjoy doing it poorly.

I do.

# Review!

Will you write better software  
if you do what I tell you you  
need to do?

The compiler will  
not give your  
variables default  
values

# Course Requirement!

You must initialize  
your variables  
upon  
declaration.

Initializing a variable  
upon declaration

```
int number = 9;
```

Not initializing a  
variable upon  
declaration

```
int number;
```

or ...

**WAIT FOR IT....**

Stupidly losing 5  
marks

```
int number;
```

# Review!

Is it OK to declare a variable without an initial value if you give it an initial value in the next line?

# long, revisited

Initializing a long variable is done by putting L at the end of the value

e.g. long population = 40L;

# char, revisited

“single character  
or integer with  
small range”

# Relationship between characters and numbers

# ASCII Codes are found in the ASCII Table

	0	1	2	3	4	5	6	7
0	NUL	DLE	space	0	@	P	`	p
1	SOH	DC1 XON	!	1	A	Q	a	q
2	STX	DC2	"	2	B	R	b	r
3	ETX	DC3 XOFF	#	3	C	S	c	s
4	EOT	DC4	\$	4	D	T	d	t
5	ENQ	NAK	%	5	E	U	e	u
6	ACK	SYN	&	6	F	V	f	v
7	BEL	ETB	'	7	G	W	g	w
8	BS	CAN	(	8	H	X	h	x
9	HT	EM	)	9	I	Y	i	y
A	LF	SUB	*	:	J	Z	j	z
B	VT	ESC	+	;	K	[	k	{
C	FF	FS	,	<	L	\	l	
D	CR	GS	-	=	M	]	m	}
E	SO	RS	.	>	N	^	n	~
F	SI	US	/	?	O	_	o	del

<http://www.asciitable.com>

0 to 255  
correspond to  
characters

values 65 to 90  
are  
letters 'A' to 'Z'

A B C D ... X Y Z

values 97 to 122

are

letters 'a' to 'z'

a b c d ... x y z

values 48 to 57

are

digits '0' to '9'

0 1 2 3 4 5 6 7 8 9

value 32 is  
the SPACE character

NOT SPACE

punctuation, graphical  
characters, and control  
characters make up the  
balance

# char duality

that means that  
lower-case 'a'  
is equivalent  
to an ASCII  
value of 97

Dec	Hx	Oct	Html	Chr
96	60	140	&#96;	`
97	61	141	&#97;	a
98	62	142	&#98;	b
99	63	143	&#99;	c
100	64	144	&#100;	d
101	65	145	&#101;	e
102	66	146	&#102;	f
103	67	147	&#103;	g
104	68	150	&#104;	h
105	69	151	&#105;	i
106	6A	152	&#106;	j

# Proof!

```
printf("%d %c", 97, 97);
```

and

```
printf("%d %c", 'a', 'a');
```

display the same thing!

(%c in a printf() format string displays a character)

# Review!

Can a number and a letter be  
the same thing?

# Review!

How do you pronounce ASCII?

# Review!

What website is the easiest to go to if you need to find out what the ASCII value for 'q' is?

# printf() formatting codes

## Highlights from Table 3-3 in the Course Notes:

%d: signed int

%f: floating point

%c: single character

%s: string

%%: just display a percent sign

# Example

```
char letter = 'a';  
printf("%c\n", letter);  
printf("%d\n", letter);
```

# Arithmetic on char variables

You can do math on chars

$$\text{'A'} + 1 = \text{'B'}$$

$$\text{'C'} + 3 = \text{'F'}$$

$$\text{'R'} - 1 = \text{'Q'}$$

```
char letter = 'a';  
letter = letter + 1;  
printf("%c\n", letter);  
printf("%d\n", letter);
```

You need to use  
this knowledge  
for Assignment  
#1!

# Naming

Give variables  
meaningful  
names!

The name of a variable should  
tell you about what it is used  
for

```
int weight = 200;  
int studentsInClass = 30;  
float interestRate = 0.05;
```

# Words in names

Distinguish between words in  
variable names!

# Two accepted methods

1) Capitalize words after the  
first one

or

2) Put an underscore between  
the words

e.g. wheelDiameter or  
wheel\_diameter

# Why?

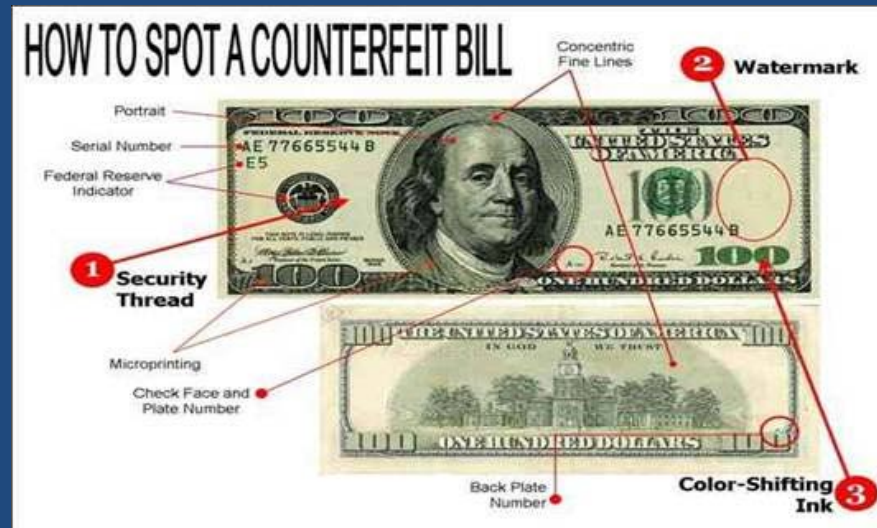

# Code clarity!

# Example

Variable indicating the quality of a counterfeit banknote ...

int noteQual

OK!

int note\_qual

OK!

int notequal

NO!!!

Of course, a better option  
would be

int noteQuality

# Legal characters in variable names

1) Letters

2) Numbers

3) Underscores

(you can't start a variable name with a number, though)

# Review!

What does the variable mfa  
keep track of?

# Review!

What does the variable  
`marksForStudents` keep track  
of?

# Constants

Variables  
vary

Use constants  
when the  
value will  
never change

Never ever ever???

No, when you never want  
the program to change  
the value,  
intentionally or  
accidentally

# Examples

maxNameLength

John Jacob  
Jingleheimer  
Schmidt

kmToMiles

*No application refused!  
28.8% APR*

maximumInterestRate

# Why?

Easy to make changes later!

# Review!

Should a currency exchange rate be a variable or a constant?

# Review!

Should a maximum frequency on an FM radio be a variable or a constant?

# Review!

Should the maximum number of students allowed in this classroom be a variable or a constant?

# One way of making a constant

Put const before a variable  
declaration

# Example

const float

maximumInterestRate= 0.28;

# Another way of making a constant

Use `#define`

# Example

No Semicolon!

```
#define maximumInterestRate 0.28
```

Preprocessor  
Directive

Name of Constant

Value

Preferred: `const`

# SET Coding Standard

Start constants with a k

OR

all in UPPERCASE

# Example

```
const int kCmInAMeter = 100;
```

# Good Rule of Thumb

Use constants whenever you  
can

# Summary

1. Variables have name, data types, and initial values.
2. There's a lot of data types.
3. There's an ASCII table.
4. Name variables clearly.
5. Use constants when needed.
